

YOUR FULL REPORT

Are you burned out—or just tired?

Your system needs real relief

Score band: 36–45 points · Career

What this report covers

A serious relief plan for sustained depletion that ordinary time off is not repairing.

Inside:

1. Why productivity tricks are not enough
2. Safety and health priorities
3. A concrete reduction-and-recovery plan

→ Full details for each section on page 2

Your result

Your system needs real relief (36–45 points)

Your answers suggest sustained depletion that ordinary rest is not repairing. This deserves more than another productivity trick.

Try this next

Prioritize safety, medical or mental-health support, and concrete workload reduction—not simply working harder to catch up.

Your practical guide

A serious relief plan for sustained depletion that ordinary time off is not repairing.

1 Why productivity tricks are not enough

Productivity tricks cannot fix a system-level depletion — and continuing to try them is part of the harm. The inbox-zero methods, the 5am routines, the optimization frameworks all assume a functioning engine that needs tuning; yours needs rebuilding. Recognize the trap: each failed trick becomes evidence that you are the problem ("I just need more discipline"), deepening the shame that burnout feeds on. Stop optimizing. The only interventions that matter now are subtractive and restorative: radically less load, genuine rest, and time — weeks to months, not a long weekend. Anything promising a quick fix is selling something, and what it is selling is denial.

2 Safety and health priorities

Safety and health are the priorities now, in this order. First, stabilize the basics: sleep (protect it aggressively, seek medical help if it is broken), nutrition and movement (gentle — this is not the time for intense regimens), and substance honesty (if alcohol or anything else has become load-bearing, that needs addressing, not judgment). Second, reduce the load decisively: medical leave, reduced hours, quitting the second job, saying no to everything non-essential — these are health interventions, not career setbacks. Third, get professional support: a doctor for the physical, a therapist for the rest. If you are having thoughts of harming yourself, contact 988 now. Everything else can wait; your health cannot.

3 A concrete reduction-and-recovery plan

A concrete recovery plan has phases, and rushing them causes relapse. Phase one (weeks): stabilize — sleep, basic routine, professional support engaged, load radically reduced. No big decisions here; your judgment is compromised and that is normal. Phase two (months): rebuild slowly — add back one meaningful activity at a time, notice what restores versus drains, address the patterns that led here with your therapist. Phase three: redesign — change the work conditions, boundaries, or role that created this, because returning to the same setup reproduces the same result. Expect the full arc to take months, with setbacks that are normal, not failure. Recovery is not linear; it is a direction. Yours starts with the first subtraction, today.
