

YOUR FULL REPORT

Are you burned out—or just tired?

Recovery is thinning

Score band: 14–26 points · Career

What this report covers

An early-intervention plan for recovery that is starting to thin out.

Inside:

1. The answers that raised your score
2. What to remove before adding fixes
3. A one-week energy experiment

→ Full details for each section on page 2

Your result

Recovery is thinning (14–26 points)

You are still functioning, but rest may not be fully catching you up. Early changes are easier than emergency changes.

Try this next

Remove, delay, or delegate one recurring demand this week.

Your practical guide

An early-intervention plan for recovery that is starting to thin out.

1 The answers that raised your score

Go back to your answers and find which ones raised your score — they point at the specific leak. Was it the emotional exhaustion questions (dreading the day, running on empty)? The detachment ones (cynicism, going through the motions)? The effectiveness ones (things that used to be easy now feel hard)? Each cluster has a different fix: exhaustion needs load reduction, detachment needs meaning or autonomy restoration, ineffectiveness needs support or skill-building. Most people try generic self-care for all three and wonder why it fails. Your answers are diagnostic — read them that way, and target the actual cluster instead of the generic "burnout" label.

2 What to remove before adding fixes

Before adding fixes — the meditation app, the morning routine, the supplements — remove one thing. Recovery thinning means your load exceeds your capacity, and no amount of optimization outruns arithmetic. The removal candidates: the commitment you dread, the "quick" favor that is never quick, the meeting you attend out of habit, the standard you hold that nobody requires. Choose one and remove it this week — decline, delegate, or delete. Notice how much energy returns from subtraction versus addition. Burnout advice focuses on adding wellness; the actual cure usually starts with subtracting burden. Make space first, then decide what deserves to fill it.

3 A one-week energy experiment

Run a one-week energy experiment with real data. Each evening, rate energy 1-5 and note the day's top three activities. Also track two interventions you choose: say, a real lunch break away from your desk and a hard stop at 6pm. After seven days, look at the pattern — which days scored highest, and what was different? This is not journaling for its own sake; it is personal science. Most people discover their energy is far more controllable than they believed — specific activities, specific times, specific boundaries move the needle. One week of data beats a year of guessing about what restores you. Then keep what worked and test the next variable.
